

DHOP

Digital Hotel Operations Platform

Software Overview & Feature Guide

EXECUTIVE SUMMARY

What DHOP Is

DHOP (Digital Hotel Operations Platform) replaces the WhatsApp groups, printed door hangers, and phone calls that most independent hotels run on today with one shared, live system. Reception, housekeeping, kitchen, and guests all read and write the same real-time board — a request raised in a guest's room reaches the right department instantly, and a room marked clean updates everywhere at once.

The platform is built around three connected portals — a guest portal, a staff portal, and an owner/manager portal — all reading from and writing to the same database in real time, and a payments layer built MoMo-first for the Ghanaian market rather than as an afterthought.

Three Portals, One Live System

Guest Portal

A mobile web portal every guest reaches by scanning the QR code in their room — no app to download, no password to remember. Guests order food, raise requests, chat with reception, book activities, and view their bill in real time.

Staff Portal

A shared installable web app used at reception, in the kitchen, and by housekeeping and maintenance staff. Fast PIN tap-in on shared tablets, with every action attributed to the staff member who performed it.

Owner / Manager Portal

A secured login (email and password) for hotel owners and branch managers to manage staff accounts, oversee occupancy and open requests, and — for hotel groups — manage multiple properties from one place.

SYSTEM OVERVIEW

How The System Works

Every part of DHOP is connected through one shared database with real-time updates, so no one is ever waiting on a phone call to find out what's already happened elsewhere in the hotel.

The guest journey

- **Arrival** — Reception checks the guest in at the desk (under a minute). The room's QR code immediately becomes active for that guest's stay.
- **Access** — The guest scans the code in their room and lands directly in their own portal. A second device (a partner's phone) can join by entering the guest's last name and the room code — with reduced access until it's confirmed from inside the room.
- **During the stay** — Every request, order, or message the guest sends appears instantly on the relevant staff screen. Every reply and status update appears instantly back in the guest's portal.
- **Departure** — The guest checks out (or reception does it for them), their bill settles, their session on every device closes automatically, and the room is handed to housekeeping the same moment.

The staff experience

Staff tap in with a 4-digit PIN on a shared tablet at their station. Every department works from the same live Room Status Board and request queues — a room marked “dirty” by housekeeping is visible to reception the same instant, with no call required.

The manager view

Owners and branch managers sign in separately, with a real password-protected account, to add and manage staff, and to see occupancy and open-request activity across their property (or properties) at a glance.

PORTAL 1 OF 3

The Guest Portal

Designed around a simple rule: guests should never need to install anything or remember a password to get help during their stay.

Getting in

- **QR check-in** — scan the code printed in the room and the portal opens instantly, already linked to that guest's stay and bill.
- **Second-device access** — a travelling companion can join from their own phone with just the guest's last name and the room's code.
- **Tiered access** — a device that scanned the physical room code gets full access (including the live bill and checkout); a second device joined remotely gets everything except billing, protecting the guest from anyone else who happens to know the room number.

What guests can do

Room requests	Housekeeping, maintenance, and laundry requests — submitted in seconds and tracked through to completion, with the option to reopen if something wasn't actually resolved.
Food & beverage	A live menu, organised by category, with items instantly marked sold out across every guest's screen the moment the kitchen runs out. Orders can be paid immediately or charged to the room.
Live bill	Every charge appears the moment it's placed — no surprise at checkout.
Activities & facilities	Spa, tours, and other bookable experiences with live availability, so two guests can never accidentally book the same slot.
Chat with reception	A direct line to the front desk for anything that doesn't fit a request form.
Tipping	A simple way to tip staff directly through the portal.
Lost & found	Report a lost item, or check what's been handed in.
ID upload	A secure way to submit ID during check-in, visible only to reception.
Express checkout	Settle the bill and check out without a trip to the front desk.
Guest profile & return stays	Guests can opt in to have their details remembered for a faster check-in next time — fully deletable on request.

PORTAL 2 OF 3

The Staff Portal

One shared app for every department, installed on shared tablets and personal phones, built around fast tap-in and a live view of what's happening across the property.

Signing in

Staff tap in with a 4-digit PIN on a shared tablet. Every action is attributed to that staff member specifically, even on a device the whole department shares, and the device logs itself out automatically after a short period of inactivity.

By department

Reception	Check guests in and out, see the live Room Status Board, manage reservations, and read every guest conversation in one inbox.
Housekeeping & Maintenance	A shared request queue that automatically routes new requests to whichever available staff member has the lightest workload, and updates the Room Status Board the moment a room is marked clean.
Kitchen	A live order queue with a sold-out toggle that updates every guest's menu instantly, and low-stock alerts before an item runs out completely.
Concierge	The same guest chat inbox reception uses, for handling local recommendations and general guest questions.
Finance	Deposit and incidental-hold management tied directly to each guest's bill.

For managers

- **Room Status Board** — the live, shared source of truth every department reads from.
- **Reports** — occupancy and average response-time snapshots by department.
- **Audit log** — a full record of who did what and when, across the property.
- **Reservations & calendar** — a combined view of upcoming arrivals and activity bookings.
- **Built for real conditions** — housekeeping and maintenance actions keep working through a dropped Wi-Fi connection and sync automatically once it's back.

PORTAL 3 OF 3

The Owner & Manager Portal

A separate, more formally secured application for the people responsible for the business itself, not day-to-day operations.

What it does today

Secure sign-in

A real email-and-password account for every Owner and Branch Manager — separate from the PIN tap-in staff use on shared tablets.

Staff management

Add a new staff member, assign their department and role, set their tap-in PIN, and switch off their access instantly the moment they leave — no waiting, no manual database work.

Branch overview

A live snapshot of occupancy and open requests for every branch a manager or owner is responsible for.

Built for multi-property growth

The same account structure already supports an owner overseeing several branches from one login as a hotel group grows.

Deeper analytics — revenue comparisons, guest satisfaction trends, and full multi-branch reporting — are the natural next layer to build on top of this foundation as the business grows.

HOW GUEST & BUSINESS DATA IS PROTECTED

Security & Trust

- **Every hotel's data is isolated.** A property can never see another property's guests, staff, or bookings — enforced at the database level, not just in the app.
- **Every action is logged.** Check-ins, room-status changes, and staff account changes are all recorded in an audit trail.
- **Guest access expires automatically.** A guest's session closes the moment they check out, so the next guest in that room can never see a previous guest's bill or conversation history.
- **Billing is protected by design.** Only a device that scanned the physical room QR code can ever view or settle the bill — a device that joined remotely cannot, even with the guest's name and room number.
- **Staff see only what their role allows.** A kitchen tablet cannot see housekeeping tasks; a department manager sees their department, not the whole property, unless granted broader access.

Payments

Payments are built Mobile-Money-first, because that's how Ghana actually pays — MTN Mobile Money, Vodafone Cash, and AirtelTigo Money are all supported through a single integration, alongside card payments. Guests can pay per order or charge to their room and settle everything at checkout.

Let's Talk

This document describes DHOP as it exists today — every feature listed above is built and working. We'd welcome the chance to walk you through it live.
